

**AMENDMENTS****In the specification**

On page 6, please amend the paragraph beginning on line 16 as follows:

B1  
Data frame encoding system 20 may also alter the various Sector Information values of the ID field. For example, the sector format type as described in the various ECMA standards mentioned above has a value of 0 (indicating constant linear velocity) for DVD-ROM, a value of 0 (indicating zoneless format) for DVD R/W, and a value of 1 (indicating zoned format) for DVD-RAM. Thus, an inversion of this value by data frame encoding system 20 will give invalid values for all types of DVDs in conventional DVD players.
